FOREST SERVICE SERVICE FOREST SERVICE FORES

California Board of Forestry and Fire Protection US Forest Service, January 27, 2016

Cooperation, Collaboration & Communication:

Good Neighbor Authority (GNA)

- The Pacific Southwest Region and the CA Natural Resources Agency recently signed a GNA master agreement. This master agreement allows departments under the CA NRA to work directly with Forests to create supplemental agreements that define on the ground projects.
- GNA is a tool to engage the governor or any State Natural Resources agency to perform forest, rangeland, and watershed restoration services on National Forest System (NFS) lands. The Forest Service may partner directly with state natural resources agencies to perform activities, or through subcontracts utilizing State contracting procedures. Potential benefits include:
 - Cost savings and economies of scale: If the USFS or State NR agency is already planning an activity in the area (adjacent or near to NFS lands), or normally undertakes the majority of desired work in the area; FS or State can realize cost savings by taking advantage of leveraged funding and economies of scale, avoiding implementation inefficiencies.
 - Access: In areas where access through state or private land is required, a State agency may be best positioned to effectively execute the desired activity.
 - <u>Capacity</u>: When staff capacity is limited the partner agency may provide the capacity to execute a desired activity or may combine with planning a complementary activity nearby.

Funding

- Most type of funds can be used: appropriations, state funds, program income, and third party funding for activities that are appropriate for those funds.
- State agencies can charge their established NICRA, or if they don't have one, a default of 10 percent.
- No match is required from the State agencies.
- GNA can also be used when no transfer of funds is executed.
- For more information: http://www.fs.fed.us/farmbill/

• Prescribed Fire MOU: Public launch February 2-3

- On October 9, 2014 Plaintiffs-Appellants and the United States reached agreement for informal resolution of a case challenging the Forest Service's adoption of the 2004 Sierra Nevada Forest Plan Amendment with stipulation that "within twelve (12) months of the effective date of this Settlement Agreement, the Forest Service and Legacy agree to prepare a memorandum of understanding (MOU) to support the increased application of managed fire for ecological benefit and to support" three stated objectives.
- The Memorandum of Understanding signed in October will promote the careful and expanded use of fire for natural resource and other social benefits in California.
- The new partnership is calling for an expanded response and a broader suite of tools to restore resilience and protect communities across California's rural landscape.
- Current partners include: Sierra Forest Legacy, California Department of Forestry and Fire Protection, Sierra Nevada Conservancy, The Wilderness Society, The Nature Conservancy, Sierra Club, Center for Biological Diversity, National Park Service, the Northern California Prescribed Fire Council, the Southern Sierra Prescribed Fire Council, and Forest Service Pacific Southwest Region.
- On February 2 and 3, the MOU partners will be holding the first meeting, starting with a media kick-off on February 2.

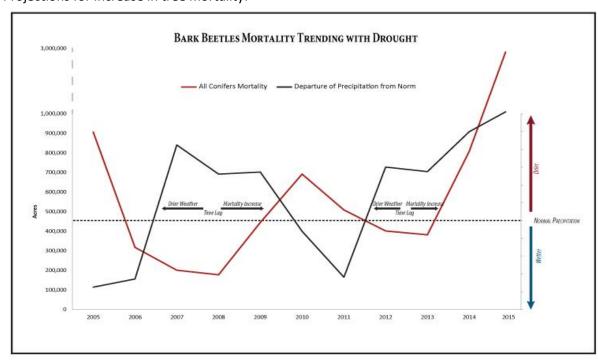

- Insect & Disease Designations: In November the Chief designated an additional 5.3 million acres for treatments in areas experiencing or predicted to experience high tree mortality. (1.5 million were initially designated in CA) for a total of 6.7 million acres (outside of wilderness, roadless or other special designations).
 - o This will allow us to expedite some NEPA on CEs up to 3,000 acres
 - Using HFRA authority, we can also expedite EAs and EISs
- Tree Mortality Task Force USFS is engaged at leadership level and sub-committee level
 - Agency is committed to working collaboratively with State and other partners to address the large scope and scale of the problem. Jeanne Wade Evans is the Region's representative on the Governor's Taskforce, and the USFS has a team member serving on each of the working groups.
 - National forests are working with their communities and counties hardest hit with tree
 mortality to protect life and property, ensure safe ingress and egress routes, sustain
 utility and communications infrastructure, and provide for safe work and recreation on
 developed areas of the forests (e.g., campgrounds).
 - Representatives in the agency are working at all levels to share information, leverage human and financial resources and build on success of past efforts, such as those in Southern California's response to tree mortality in 2003 and beyond.

Grants & Agreements

- More than \$27 million received from partners to enhance work on National Forests in 2015.
- Almost \$50 million provided to partners to support Forest Service programs and conduct work on National Forests. Partners include federal, state, and local government, and private.
- Grants and agreements funding is leveraged with partner resources including additional funds or in-kind services adding to capacity and value of projects.

Tree Mortality

Projections for increase in tree mortality:

Sierra Nevada Adaptive Management Project – effects on fire behavior or tree mortality?

- SNAMP released its final report in December, 2015
 - The U.S. Forest Service's 2004 Sierra Nevada Forest Plan Amendment calls for managing the forest using the best information available to protect forests and homes. Vegetation management treatments are planned or being conducted in several places in the Sierra Nevada where fire risk is high. A team of university scientists agreed to act as an independent third party, researching the effects of vegetation management treatments in two areas in the Sierra Nevada. Results will be used to improve forest management in the future.
 - SNAMP was formed to learn how to apply adaptive management as required in the 2004 Framework, with an emphasis on engaging the public in a meaningful way. More specifically, SNAMP was designed to assess the efficacy of forest fuels management on potential fire behavior and the impacts of that management on three essential natural resources: forest ecosystem health, wildlife, and water, while incorporating participation by all interested stakeholders, including the public.
 - A key objective was to evaluate the impact of Strategically Placed Land Area Treatments (SPLATs), a forest fuel reduction treatment, with respect to four resource values:
 - Fire and forest ecosystem health,
 - Wildlife, focusing on the Pacific fisher and the California spotted owl
 - Water quantity and quality, and
 - Public participation
 - o The final report can be found at: http://snamp.cnr.berkeley.edu/snamp-final-report/
